

PORTABLE BALL RETRIEVING DEVICE

ABSTRACT

A device for retrieving balls includes a hollow tube for receiving and dispensing a ball. The device further includes a plurality of flexible mounting brackets so that the device can be selectively mounted along a support surface. An automated coin dispensing system is connected to the tube and includes a sensor aligned with an aperture formed at a predetermined section of the tube. Such a sensor detects when a ball is passing through the tube and sends a signal to a solenoid for causing the coin dispensing system to release a predetermined amount of money.
